

Accessibility Guidelines Implementation Report

Name: Dong Nhi Truong

Student ID: 104977535

Introduction

This report discusses the accessibility guidelines and how they have been implemented for the website project. The objective is to summarize the key guidelines followed and provide examples of their implementation with evidence from accessibility testing.

The website is a prototype for a mineral water company called DropFresh. It contains the following pages – Home Page, Career Opportunities, Job Application and About Us. The goal was to make it accessible by following W3C guidelines.

Youtube link: https://youtu.be/a7V9dOq_Xno

Accessibility Guidelines

Some key guidelines that were followed include:

- Use of alt text for images - Added descriptive alt text to provide context for images on all pages like logo, graphics, icons etc. This helps vision impaired users who use screen readers.
- Semantic HTML tags - Used tags like header, nav, main, footer etc. instead of generic divs to improve structure and navigation. Assistive technologies can parse these better.
- Focus order - Set tabindex to control focus order and make navigation sequential.
- Form labels - Added labels for all form inputs on Apply page and linked them to fields using 'for' attribute for easy identification.
- Color contrast - Ensured colors met minimum 4.5:1 contrast ratio for text. Changed text if contrast was insufficient.

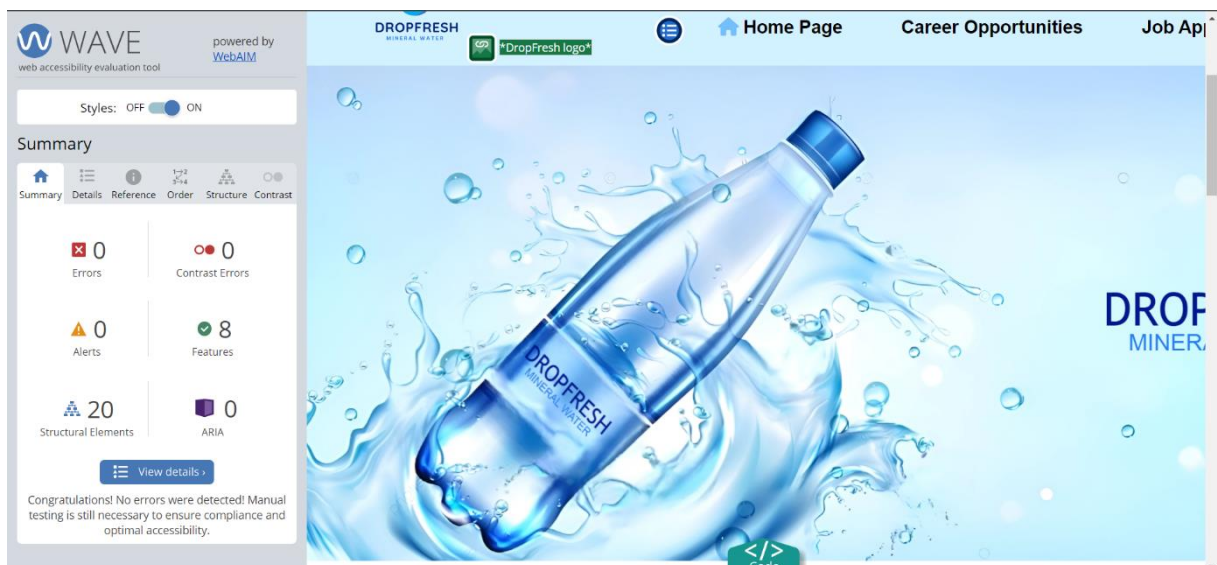

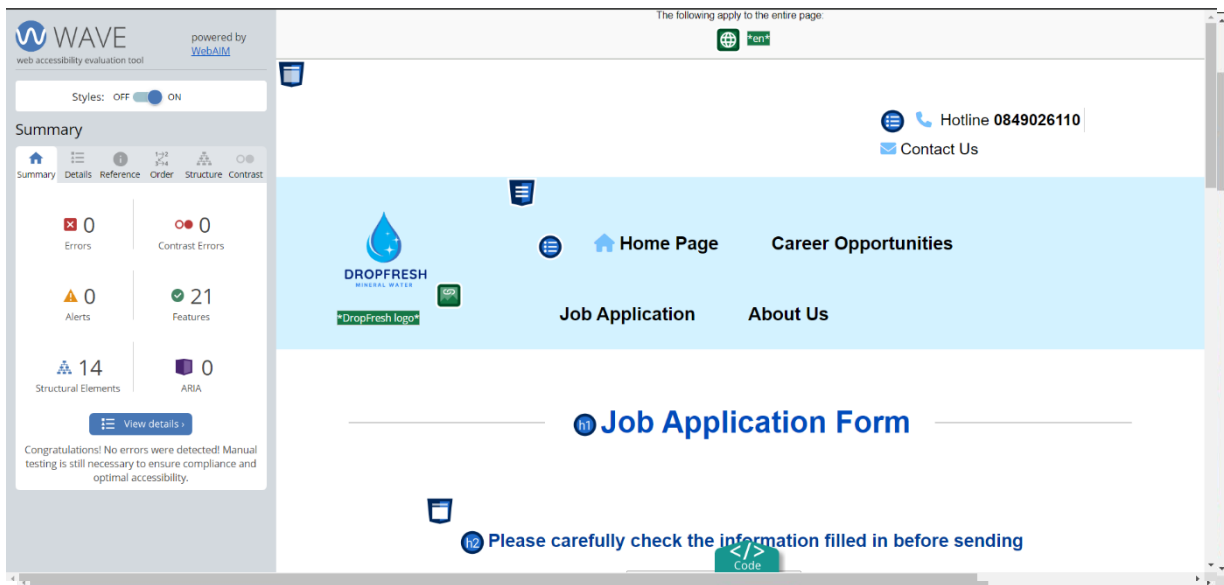

Accessibility Testing

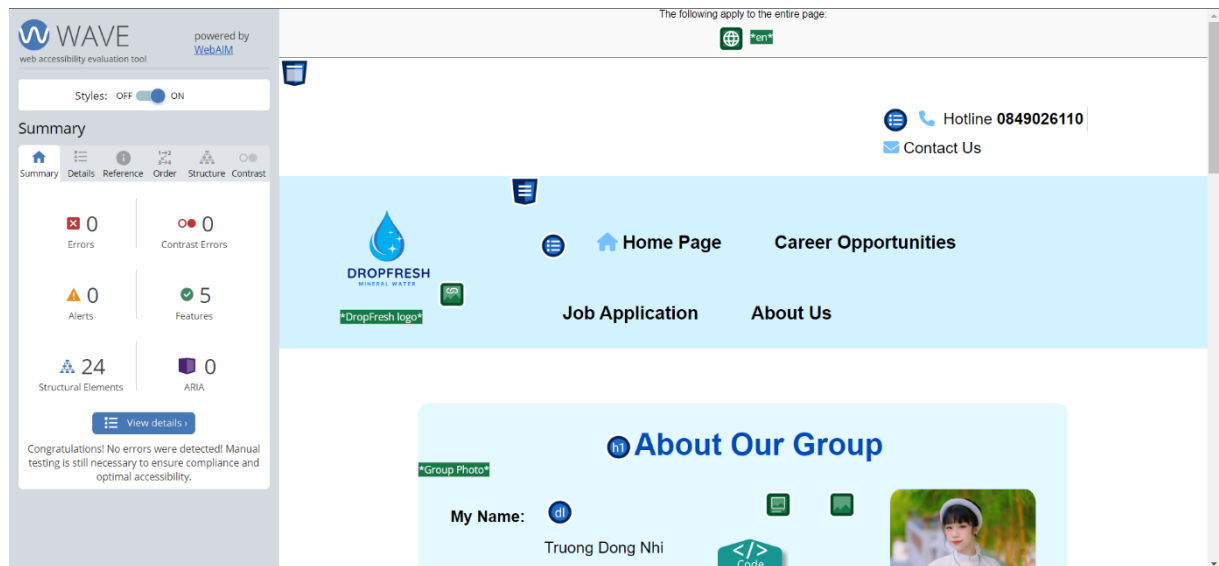

The WAVE browser extension was used to test accessibility issues. Some errors found and fixes:

Skipped heading level – adjust the heading level

Low contrast errors - Changed text color to increase contrast

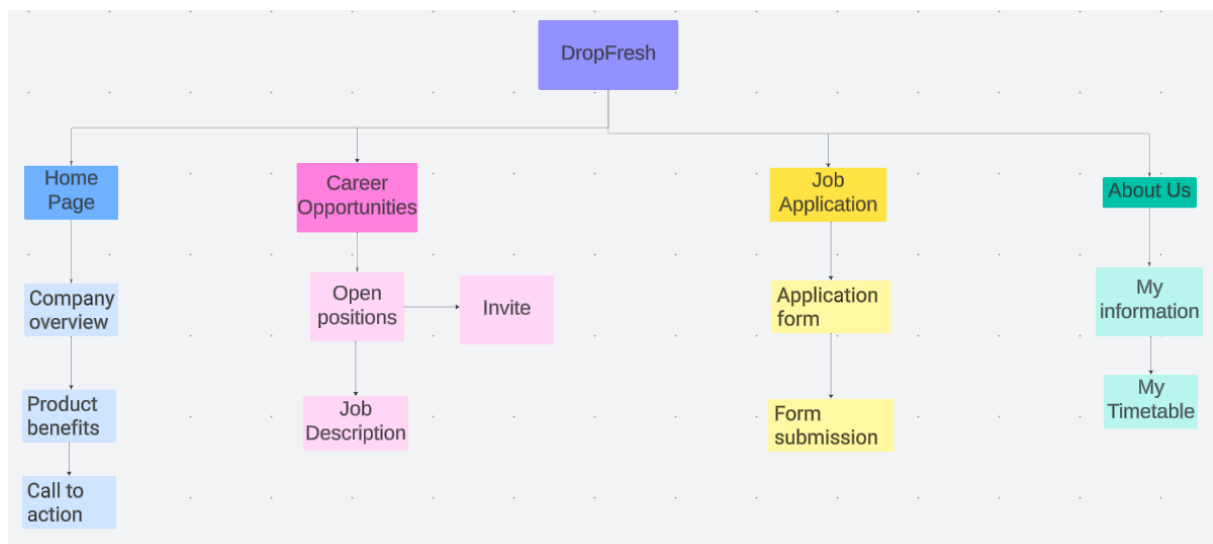

Empty link - Added text to icons

After fixes, no more errors were seen in WAVE.

Website Content and Structure

- Home Page:

The home page introduces the company DropFresh and highlights its commitment to providing pure, refreshing mineral water. It outlines the key promises like refreshing taste, purity and sustainable practices. It also encourages visitors to learn more and join the brand community.

DROPFRESH
MINERAL WATER

Welcome to DropFresh - Pure Refreshment, Every Drop Counts!

Discover Our Promise of Purity

Refreshing Taste, Pure Source:

DropFresh mineral water comes from pure springs located in untouched natural environments. The water goes through thorough filtration processes to ensure that it maintains its natural minerals and refreshing flavor.

Purity You Can Trust:

We recognize the significance of being transparent about the water you consume. That is why we offer full traceability for our water, enabling you to know its origin and the treatment process it undergoes at each stage.

Sustainable Development:

DropFresh is committed to protecting the environment by using eco-friendly packaging and sourcing products ethically. Our goal is to protect the planet for future generations while providing the cleanest water.

This page introduces me with my details like name, ID, skills etc. It also contains my timetable in a table structure. The layout uses HTML elements like definition lists, figures, and anchor links.

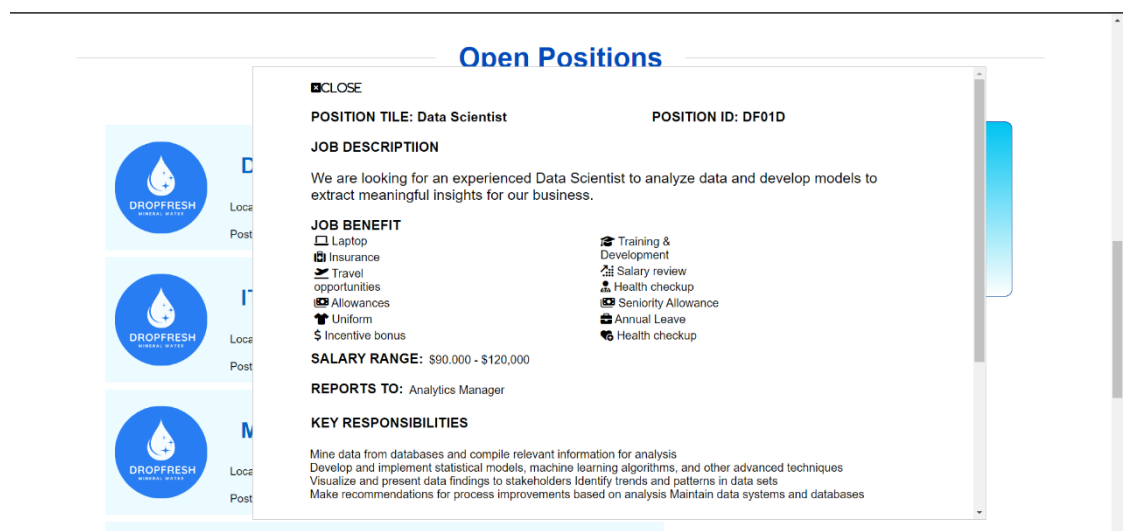

- Enhancement

APPLY NOW

+This is the auto hover feature. This feature is intended to attract users to the information I want to highlight.

For this feature I use animation: autohover and autohover keyframes. Autohover keyframes are used to format the display for it when autohover. And in this button I have added a stop state when the mouse is inserted.

Besides, I want users to be more certain about their choice, I have set the font-size to be larger when hovering to clearly see the difference.

+This is a feature when clicking 'view more', a new table will be displayed right on the interface without having to redirect to another page. This helps users save time, they can directly view the jobs they want to apply for.

In terms of code that implements this feature, in the default state, the website hides the content of the job description, this job description has an id in the general class. Then I use href="#id that I placed in 'view more'. The most important part is the css so that the hidden class displays:block when targeted.

Besides, I also have a close button at the top, when I click on it, I want it to display the jobs.html page again and target the id of that job. If it's just a simple link of the a tag, it will jump to the top of the page and make the user experience not good because they has to scroll down again.

Contributions and Conclusion

I designed and built all 4 websites above. The main challenges are finding improvements I can implement that don't have javascript. The highlight is learning about accessibility and making websites more user-friendly.

In short, the W3C's key accessibility guidelines have been followed to make the site more accessible, but it hasn't been completely fixed as some improvements are limited without the use of javascript. Testing with WAVE has helped identify and resolve a number of issues. For future improvements, the aesthetic design can be enhanced and more sophisticated features added while still maintaining accessibility.
